NativeTree

Digital Reserve and Community Custody of Patagonia

WHITEPAPER · VERSION 10 · 2026

Vodudahue, Chilean Patagonia · Stellar Network
404 Hectares · 161,600 Native Trees · Estimate based on NASA GEDI data.
In a study carried out in partnership with a Chilean company in Northern Patagonia
The oldest asset on the planet has just entered the blockchain:
"The native forest of Patagonia"

Token	NTV (NativeTree Vodudahue)
Blockchain	Stellar Network (Soroban-ready)
Equivalence	1,000 NTV = 1 tree · 400,000 NTV = 1 georeferenced hectare
Official price	0.40 EURC / token · 400 EURC per tree
Launch	Dubai

Oscar Barril Orellana
Founder of NativeTree · Owner of La Lonja, Vodudahue
53 years in Vodudahue (since 1973) · 404 ha of virgin native forest in Chilean Patagonia
Safeguarded together with his family for more than five decades.

IMPORTANT NOTICE

This document is an informational whitepaper and does not constitute a public offering of securities, nor financial, legal or tax advice. NTV tokens represent a voluntary contribution to the community custody of native trees in the Vodudahue reserve, and do not grant property rights over the land nor a share in profits. Participation is voluntary.

I. Executive Summary

NativeTree is the world's first bank of living assets. Founded in Vodudahue, Chilean Patagonia, by Oscar Barril Orellana — owner of 404 hectares of native forest — NativeTree turns the custody of the forest into a digital, transparent opportunity open to anyone in the world.

The project runs on the Stellar blockchain and issues the NTV token under one clear principle:

1,000 NTV = digital custody of 1 tree · 400,000 NTV = 1 georeferenced hectare

The project unfolds in two phases. Phase 1, now active, covers 58,660 mature native trees across the first 146.65 hectares, which are the most accessible. Phase 2 will add the remaining 257.35 hectares, completing the reserve's total of 161,600 trees.

Unlike gold or traditional carbon bonds, the living resources protected by NativeTree breathe: they capture CO_2, produce oxygen and protect biodiversity 24 hours a day.

The accumulated biomass and carbon storage capacity of the area are estimated at an average of 96 tons per hectare, according to NASA-GEDI satellite reference data and regional research.

II. Oscar Barril and Vodudahue

2.1 The Founder

Oscar Barril Orellana arrived in Vodudahue at the age of 19, in 1973. In a remote area of Chilean Patagonia, reachable only by sea and charter flights, he has safeguarded 404 hectares of native forest together with his family for more than 53 years. His credibility was built in the Patagonian rain and in a half-century commitment to a forest that never asked anything of him in return.

Philosophy	**The tree is life; its preservation is vital for the future of new generations**

2.2 The Vodudahue Reserve

Location	Hualaihué, Palena, Chilean Patagonia
Area	404 hectares
Total trees	161,600 native trees
Carbon capture	Average of 96 ton/ha · Joint NASA-GEDI study
Access	Only by sea and charter flights
Tree species	Alerce (multi-century · longest-lived species of the southern hemisphere), Coihue, Tepa, Mañío, Cypress, Ñirre
Fauna	Pudú, Condor, native fish, biodiversity unique to the southern hemisphere

---

III. The Solution: Community Custody

3.1 The problem it solves

Traditional environmental compensation mechanisms have three flaws that NativeTree corrects: lack of transparency (documents without field verification), lack of access (markets designed for companies, not individuals) and lack of permanence (contracts with arbitrary expiry dates).

A tree in NativeTree does not expire.

3.2 What each tree does

- Captures 20–30 kg of CO_2 per year (equivalent to 120 km by car)

- Three trees produce enough oxygen for 1 person per year
- Grows and captures more carbon over time
- Provides permanent habitat for endemic fauna
- Regulates the regional water cycle

IV. Scientific Validation and Technological Mapping

4.1 Reference Data (Macro-Region): The current estimate of the project's carbon capture and biomass is based on studies by a Chilean company and by the NASA-GEDI program carried out in Northern Patagonia, Chile. This regional data certifies the very high ecological value and absorption capacity of the ecosystem where our 404 hectares are located.

4.2 Purpose of the Presale (Micro-Local Mapping): This presale of the Founders' Lot has as its main objective to finance the deployment of precision technology (drones equipped with suitable sensors, and construction work at La Mila along with the full implementation of the educational farm) directly on the Vodudahue land.

This aerial scan will digitize and georeference every hectare of the property exactly, before the general launch of the main sale. Therefore, presale participants acquire liquid NTV tokens that will later be linked to their respective NFT certificates once the drone database is integrated into the Stellar blockchain.

4.3 La Posta: Handover of Family Custody

Digital custody represents a commitment to perpetual protection. When a guardian wishes to hand over their tree, through smart contracts on Stellar, the Guardian position can be bequeathed or transferred to the community and a new protector, guaranteeing an immutable record of custody without altering or felling the land. Every movement is recorded immutably on the blockchain. This is responsible rotation of guardians.

V. Tokenomics: The NTV Token

5.1 Structure

Name	NativeTree
Symbol	NTV (NativeTree Vodudahue)
Blockchain	Stellar Network
Equivalence	1,000 NTV = 1 tree · 400,000 NTV = 1 georeferenced hectare
Custody contribution	0.40 EURC / token · 400 EURC per sponsored tree.
Custody fund	Managed in EURC for the upkeep and technology of the reserve.

5.2 Issuance Phases

Phase	Hectares	Trees	NTV Tokens
Phase 1 (Active)	146.65 ha	58,660	58,660,000
Phase 2	257.35 ha	102,940	102,940,000
Total	404 ha	161,600	161,600,000

Phase 1 covers the most accessible lots. Phase 2 incorporates the areas of greatest biodiversity and altitude. Phased deployment allows the model to be validated and scaled with verified evidence.

VI. Technology: Stellar Blockchain

Stellar was chosen for four reasons:

- Minimal cost — fractions of a cent per transaction
- Speed — 3–5 seconds with absolute finality
- Soroban — auditable smart contracts for La Posta and the custody certificates, to be executed before launch
- Native EURC integration — stable liquidity in digital euros

Each NTV token is issued only when a real, georeferenced and protected tree exists in Vodudahue. Upon accumulating 400,000 NTV, the guardian receives an NFT certificate with GPS coordinates, adoption date and the Guardian’s name.

VII. Value Proposition

Individuals and families

For 400 EURC, anyone becomes the Guardian of a real tree with a blockchain certificate, a legacy transferable through La Posta, and annual satellite monitoring reports.

Companies and ESG funds

Perpetual, georeferenced certificates auditable in real time. Institutional packages of 100, 500 or 1,000 trees with naming rights.

Universities and research institutions

Living laboratory for theses and research. Co-development of robotics, drones and forestry IoT. Open time-series data on biomass and carbon.

VIII. The Green Legacy

The day a child or grandchild is born, or someone special comes into your life, you can digitally plant a real tree in Chilean Patagonia that will be there when that child turns 18,

when they marry, when they have children of their own. With La Posta, that tree passes from your hands to theirs — clean, immutable, recorded on the blockchain forever.

Birth	Your child’s first asset. A tree that grows with them.
Wedding	A gift that lasts longer than any object.
Graduation	The start of adult life with roots in Patagonia.
Memorial	Honoring those who are no longer here with a living tree.
Gift	Something no store can sell: virgin nature.

*"**The gift that breathes, grows and never expires**"*

How to participate

The private presale of the Founders’ Lot officially opens at the Dubai launch
